Developed using extensive empirical research, these innovative new reports assist psychologists in presurgical evaluations of patients being considered for spine surgery and spinal cord stimulator surgery procedures.

These highly evidence-based reports:

• Include full scoring information and an integrated interpretation of scores specifically for presurgical evaluations
• Compare a candidate’s test results to those of more than 1800 spinal surgery and spinal cord stimulator surgical candidates
• Identify psychological risk factors from nine problem domains:
  - Demoralization and Depression
  - Pain and Somatic Sensitivity
  - Pain Coping
  - Health Orientation and Medical Adherence
  - Anxiety and Stress
  - Fear/Avoidance
  - Interpersonal
  - Substance Abuse
  - Recovery Disincentive
• Highlight areas of increased postsurgical risk relative to other candidates as well as associated treatment-focused recommendations specifically for these presurgical populations
• Provide comprehensive and transparent annotations and research references for all interpretive statements

Superb identification of relevant risk factors shown to be associated with outcome and a very important discussion of treatment options that might improve the outcomes for tenuous candidates.”

Brent Van Dorsten, PhD
President
Colorado Center for Behavioral Medicine

The reports are remarkable for integrating the large and complicated empirical literature—a magnificent feature that will save clinicians a great deal of time.”

M. Scott DeBerard, PhD
Associate Professor
Department of Psychology
Utah State University

These data-driven reports provide a valuable summary for clinicians as they seek to provide guidance regarding planning for stimulators or for surgery.”

Timothy S. Clark, PhD
Baylor Center for Pain Management
Dallas, TX
